Confirmation for Sepehr Rahmani

Mr. Sepehr Rahmani, born on 26.06.1998, was a student in my lab at University Hospital Zürich, Switzerland, from 01.09.2021 to 31.01.2022. During this time, he successfully performed an internship research project.

For his research project, Sepehr worked primarily on a novel aspect of an existing project within my lab, which focusses on the role of the anti-apoptotic gene Mcl1 in the DNA damage response. More specifically, Sepehr strived to determine whether simultaneous deletion of Mcl1 and Parp1 would result in synthetic lethality in non-transformed human colon epithelial cells. As a very ambitious student, Sepehr mastered and utilised a range of molecular biology techniques during his relatively short time in my lab. Sepehr integrated very well into my research team and his collaborative and communication skills were highly appreciated among the other lab members.

Overall, Sepehr completed a successful internship project within my lab. I was impressed with his technical ability and confidence when performing experiments that far exceeds his early career stage. I would happily recommend him to any future research position and wish him every success in the future.

Sincerely yours,

Achim Weber
